October 24, 2007

Abstract

Building integrated, interoperable software on large inter-organizational scales requires a different approach than typical "in-house" software development. The commercial industry has implemented effective techniques to tackle this problem. They leverage open source development, standards bodies, and emerging technologies to break down the barriers. This presentation will cover some of those processes, standards bodies and emerging technologies citing real world examples of work for the Department of Defense (DoD).

Location: Tech Center 111

Time: 3:30-4:30PM, 10/24/2007, Wednesday

Pizza and other refreshments will be served!
